

Bhoomimitra

One record, every statute, every parcel — from notification to mutation.

A case-management platform for land acquisition in India

Every acquisition still runs through paperwork pretending to be data.

Land acquisition in India touches more than a dozen laws — the Right to Fair Compensation and Transparency Act of 2013, the National Highways Act, and Fourth Schedule exemptions covering railways, atomic energy and defence — yet the systems built to manage it were each built for one of these laws alone.

LACRRIS reports on RFCTLARR proceedings after officers have already completed them elsewhere. Bhoomi Rashi manages notifications for national highways only. The Digital India Land Records Modernisation Programme still carries cadastral maps that have fallen out of step with the boundaries they describe on the ground.

The cost of this fragmentation is measured in delay. In March 2025, the government told the Rajya Sabha that 697 highway projects were running behind schedule, with roughly 35 percent of that delay attributed to disputes over land acquisition. Behind that figure sit families waiting on an award, hectares held under notifications nobody is tracking against their own deadlines, and district offices where fixing a data-entry error still means writing a letter to Delhi.

One acquisition, tracked as a single continuous case.

Bhoomimitra follows an acquisition from the first project proposal to the day the revenue record changes hands — consent, social impact assessment, notification, objections, survey, declaration, award, payment, possession and mutation — each one a dated, auditable event rather than a document filed away and forgotten.

Every parcel carries one identity nationwide, drawn from its ULPIN, so the same acquisition can never be entered twice by two different district offices. Every statute — RFCTLARR, the National Highways Act, or a state act with its own timeline — is held as configuration rather than code, so bringing a new law onto the platform is a matter of adding rows to a table, not rebuilding the system around it.

And every family the Act was written to protect has a record of their own. Owners, co-owners, tenants, sharecroppers and landless labourers dependent on the land are each represented, because rehabilitation and resettlement entitlements under RFCTLARR extend well past the person who holds the title.

Built on a small number of firm rules.

These principles came from studying, in detail, where the existing systems fail. Each is a constraint on how Bhoomimitra is built, not a feature we hope to add later.

-
- **Records are born in the workflow.**
A total on a dashboard is a sum of real events that happened in the system — never a figure typed in on its own.
 - **Corrections are a feature, not an escalation.**
Any record can be corrected by the right official, with a reason, a timestamp, and the original value preserved permanently.
 - **The law is data.**
Adding a new act, or an amendment to an existing one, is a configuration change — not a rewrite of the platform.
 - **Geometry has two truths.**
The officially surveyed boundary and the field-verified boundary are both kept, and where they disagree, that disagreement is visible, not smoothed over.
 - **Deadlines raise alarms before they pass.**
Every statutory clock — a declaration due within twelve months of notification, an award due within twelve months after — is tracked and flagged before it lapses.
-

What Bhoomimitra does.

Statutory Deadline Engine

Tracks Section 19, 25 and 101 clocks, and their state-act equivalents, raising an alert before a notification lapses or land falls due for return.

National Parcel Identity

Uses ULPIN as the parcel's key nationwide, catching duplicate project entries before a second record is ever created.

Family & Entitlement Register

Records every affected family — including tenants and landless labourers — and tracks their resettlement entitlements individually.

Dual Geometry Verification

Holds the cadastral boundary and the field-verified boundary side by side, and flags where the two diverge.

Multi-Statute Case Engine

Runs RFCTLARR, the National Highways Act and individual state acts on a single schema, configured rather than hard-coded.

Auditable Correction Trail

Every edit keeps its reason, its author and its previous value, permanently and visibly.

State Land-Records Integration

Pushes a mutation request to the relevant state land-records system the moment possession is formally recorded.

Citizen Transparency Portal

Lets any landowner search their survey number or ULPIN and see their parcel's stage, award and payment status.
